

References & Pointers

References

In C++, a *reference* variable is an alias for another object. It is created using the & sign. Two things to note:

- 1. Anything done to the reference also happens to the original.
- 2. Aliases cannot be changed to alias something else.

```
int &sonny = songqiao;
```

Pass-By-Reference

In C++, pass-by-reference refers to passing parameters to a function by using references. It allows the ability to:

- Modify the value of the function arguments.
- Avoid making copies of a variable/object for performance reasons.

```
void swap_num(int &i, int &j) {
    int temp = i;
    i = j;
    j = temp;
}
int main() {
    int a = 100;
    int b = 200;
    swap_num(a, b);
    std::cout << "A is " << a << "\n";
    std::cout << "B is " << b << "\n";
}</pre>
```

const Reference

In C++, pass-by-reference with **const** can be used for a function where the parameter(s) won't change inside the function.

This saves the computational cost of making a copy of the argument.

```
int triple(int const &i) {
  return i * 3;
}
```

Memory Address

In C++, the *memory address* is the location in the memory of an object. It can be accessed with the "address of" operator, &.

Given a variable porcupine_count , the memory address can be retrieved by printing out

&porcupine_count . It will return something like: 0x7ffd7caa5b54 .

Pointers

In C++, a *pointer* variable stores the memory address of something else. It is created using the * sign.

Dereference

In C++, a *dereference reference operator*, * , can be used to obtain the value pointed to by a pointer variable.

```
std::cout << &porcupine_count << "\n";</pre>
```

```
int* pointer = &gum;
```

```
int gum = 3;

// * on left side is a pointer
int* pointer = &gum;

// * on right side is a dereference of
that pointer
int dereference = *pointer;
```
